The latest in flood management technology

Predict future flooding events with our flood risk management technology and be alerted of any changes in weather patterns that may lead to rising waters; a key tool in preventing downtime and limiting disruption.

Climate change is bringing increasing frequency of significant flooding events and incidences of extreme weather.

Adler & Allan's Flood Risk Management Technology **FloodMarshal™** is the most advanced of its kind and helps businesses to understand their flood risk and subsequent threats to business continuity.

FloodMarshal™ technology predicts future flash flooding events across a business' sites and alerts the customer of any changes in weather patterns that may lead to rising waters. Organisations have a whole picture of the flood risk across their business to ensure business continuity is achieved and the relevant measures can be put in place.

WHY?

Business property suffered the most at the hands of the infamous storms of 2015/2016 with an impact cost estimated around £530 million. Going forward, the UK is predicted to be one of the country's worst affected by rising water levels; utilising A&A's industry-leading software will provide the commercial sector with valuable information that could lead to significant long-term savings from disruption.

HOW?

By understanding risk, steps can be taken to mitigate against it - be that through the implementation of flood plans and defences, prioritising the safety of key assets, or by considering a move to safer premises and avoiding investment in a site that may flood in the future.

WHAT?

Delivered as a stand-alone service, or as part of A&A's 360° flood resilience service, designed to help businesses prepare, protect, respond and recover from flooding, FloodMarshal™ gives UK businesses the information to prevent downtime, limit disruption and make the right decisions when it comes to operational safety and efficiency.

About Adler & Allan's flood risk management software, FloodMarshal™:

- Disseminates flood warnings timely and accurately to enable critical decisions, delivered by automated email and SMS alerts
- Is fully integrated with the Environment Agency and Natural Resources Wales Data for Risk of Flooding by Rivers, Seas and Surface Water
- Provides users with automated flood risk scores based on geospatial data
- Enables management of mitigation equipment, costs, business continuity plans and prioritisation of investment in assets
- Updated every 15 minutes with the nearby river gauge and rainfall gauge data
- Follows social media outlets such as Twitter to track crowdsourced flood events
- Intuitive dashboards, reports and charting for rapid analysis
